

recharge.green – balancing Alpine energy and nature

The Alps have great potential for the use of renewable energy. Thereby they can make a valuable contribution to mitigating climate change. This, however, means increasing pressures on nature. What could be the impact of such changes on the habitats of animals and plants? How do they affect land use and soil quality? How much renewable energy can reasonably be used? The project recharge.green brings together 16 partners to develop strategies and tools for decision-making on such issues. The analysis and comparison of the costs and benefits of renewable energy, ecosystem services, and potential trade-offs is a key component in this process. The project will last from October 2012 to June 2015 and is co-financed by the European Regional Development Fund in the Alpine Space Programme.

Choose the percentage of the prescription (%):

The percentage of the forest increment/yield to insert in the analysis. With this step it's possible to choose the level of the wood biomass that is possible to use to produce energy. In this step it's possible to product different scenarios taking into account more prudential values like 50% of prescribed yield or higher values like 100 % of prescribed yield.
