

Step 4. Choose the environmental protection level:

A “low” environmental protection level indicates that the biomass can be collected up to 50% of the availability in no protected area, 40% in low protected areas, 30% for medium protected areas and 10% for highly protected areas (e.g., national parks, natural reserve).

A “high” environmental protection level indicates that the biomass can be collected up to 20% of the availability in no protected area, 10% in low protected areas, 5% for medium protected areas and 0% for highly protected areas.
